

Flooded Roads

Excessive water on a road may cause flooding. This can happen gradually or suddenly. It is important to understand the dangers of water on the road, including:

- Being swept off the road.
- Floating debris and unseen hazards.
- The road collapsing.
- Vehicle malfunction.
- Electrocution if there are fallen power lines.

It may not be possible to determine the depth of the flood by looking. If the water is deep, the road may be too dangerous to cross. It is best to find another route. If you have no other option but to drive through a flooded road, drive slowly. After you make it through the water, test your brakes to make sure they work correctly.

High Winds

High winds can be a hazard while driving. This is especially true for larger vehicles such as trucks, campers, and vehicles with trailers. When driving in high winds:

- Reduce your speed. This gives you better control over your vehicle. You will have more time to react if your vehicle gets hit by a strong gust of wind.
- Maintain a firm hand position on the steering wheel. Strong wind gusts are unpredictable. If you are not holding the wheel properly and a gust hits, you can lose control of the vehicle.
- Be alert. Look ahead and watch for any debris on the road. Give yourself enough time to react to road hazards.
- Do not use cruise control. Maintain maximum control of the accelerator if a gust occurs.
- Be proactive. It may be safer to pull over and wait for the storm to pass.
