

FIELD OF VISION

You'll use three types of vision while you're driving. Higher speeds reduce the quality of each type of vision.

1. **Central vision** allows you to see detail straight in front of you. It's the vision you're using to read these words.
2. **Fringe vision** is what you use to see the edges of the driver guide pages. You can see it, but it may not be very focused.
3. **Peripheral vision** is what you can see to the side of you without losing focus on the words. It could be the walls of the room you're in or someone walking past you.
